SUMMARY

Backend software engineer with 5+ years of experience building distributed systems for fintech: KYC and compliance engines and customer onboarding for Banking as a Service (BaaS). I work mainly with Go, Node.js, TypeScript and AWS, designing event-driven architectures with asynchronous processing, the outbox pattern and infrastructure as code (Terraform). AWS Certified Solutions Architect – Associate.

WORK EXPERIENCE

Software Engineer · Transfeera

Nov 2025 – Present

Brazilian fintech regulated by the Central Bank: payments and Banking as a Service

KYC, compliance & regulatory

- Implement Central Bank of Brazil (BCB) regulatory requirements: Transfeera is directly regulated, so new rules become changes to our products and platform.
- Built a rules-based KYC risk-scoring engine with weighted scoring and eligibility checks, turning compliance requirements into domain rules together with the compliance team.
- Integrated multiple external KYC, AML and antifraud data providers into the automated customer onboarding flow.

Enrichment engine

- Designed a client-data enrichment engine that runs synchronous and asynchronous steps in parallel, reuses previous results, matches async provider callbacks by correlation ID, and orchestrates child steps until a terminal state.
- Built bulk reprocessing to run existing customers through the enrichment and risk-scoring engines, with a leaky-bucket rate limiter in front of the data-provider APIs that queues calls near each plan's quota: fast throughput without HTTP 429 errors.

Banking as a Service (BaaS) onboarding

- Building automated onboarding and eligibility flows for the BaaS product with domain events, the transactional outbox pattern and asynchronous integrations between services.
- Process account and customer events with AWS SNS and SQS queues, using subscription filtering, deduplication and message groups for ordered, high-throughput delivery.

Platform & tooling

- Designed a streaming upload path in Go (Fiber/fasthttp) for files up to ~20 MiB without loading them into memory, streaming multipart uploads straight to Amazon S3.
- Built an engineering wiki on pgvector (ADRs, GitHub and Notion decisions) that AI agents query and update through an MCP server, plus a Slack command for small decisions.

Tech: Go, Kubernetes, AWS, PostgreSQL, pgvector, MCP, Grafana, hoop.dev, Sentry

Full Stack Developer · IDIP Tecnologia

Oct 2022 – Nov 2025 · Brasília, Brazil · Remote

Software house building products for fintech, healthcare and industry clients

- Migrated a B2B credit-granting platform from a monolith to microservices on AWS ECS and Lambda, integrating CAF antifraud, Parcelex and Vindi, with API-to-API authentication through Amazon Cognito and Secrets Manager.
- Built a B2B document-delivery platform over WhatsApp with AWS Lambda, S3 events and SQS (working around API Gateway limits), with a chatbot and a React admin dashboard.
- Coordinated 4 junior developers across 2–3 concurrent projects: technical guidance, code reviews and architecture planning for microservices.
- Provisioned infrastructure as code with Terraform, Serverless Framework and CloudFormation, and built CI/CD pipelines in GitHub Actions, GitLab CI and AWS CodePipeline, with integration tests using Jest, Vitest and Testcontainers.
- Integrated payment providers (Stripe, Asaas, Cielo, Itaú, Mercado Livre) and migrated data from Firebase to PostgreSQL and MongoDB with zero downtime.
- Reduced AWS costs by automating EC2 start/stop schedules with Lambda and Slack commands.

- Modernized an on-premises delivery PWA in React and Node.js, and built Java APIs integrated with factory conveyor systems, using Redis for caching.

Tech: Node.js, TypeScript, Python, Java, React, Next.js, AWS Lambda, AWS ECS, SQS, SNS, S3, DynamoDB, Cognito, PostgreSQL, MongoDB, Redis, Terraform, Serverless Framework, Docker, GraphQL, Hasura, Jest, Testcontainers

Education Mentor · **Skule Tecnologia** Mar 2023 – Jul 2023 · Remote

- Mentored 6 programming interns on Node.js, Next.js and React projects: reviewed pull requests, resolved merge conflicts and guided code improvements.
- Ran technical sessions in English on clean architecture and coding best practices.

Frontend Developer · **Advanced Digital** Feb 2022 – Oct 2022 · Brasília, Brazil

- Maintained and extended a React and Redux e-commerce app with a Node.js backend, and migrated a ticket-selling UI from PHP to React.
- Integrated the Cielo and Mercado Livre APIs through custom React hooks, and built web scrapers in Node.js.
- Helped launch two mobile MVPs in Flutter (Dart, GetX).

Tech: React, Redux, Node.js, Flutter, Dart, SCSS

TECHNICAL SKILLS

Languages: Go (Golang), TypeScript, JavaScript, Node.js, Java, Python, SQL

Backend & architecture: REST APIs, GraphQL, Microservices, Event-driven architecture, Domain events, Transactional outbox, Asynchronous processing, Rate limiting, Fiber, NestJS, Express, Fastify

Cloud (AWS): Lambda, ECS Fargate, EKS, SNS, SQS, S3, DynamoDB, Cognito, Secrets Manager, API Gateway, CloudFront, VPC, CloudFormation

Infrastructure & DevOps: Kubernetes, Terraform, Serverless Framework, Docker, GitHub Actions, GitLab CI, AWS CodePipeline, CI/CD

Databases & messaging: PostgreSQL, MongoDB, DynamoDB, Redis, Kafka, RabbitMQ, SNS/SQS

Fintech & compliance: KYC, AML / sanctions screening, Risk scoring, Antifraud, Customer onboarding, Banking as a Service (BaaS), Payment integrations

Testing & observability: Go testing, Jest, Vitest, Testcontainers, Grafana, Sentry

Frontend: React, Next.js, Redux, PWA

PROJECTS

Dyosmos Video walkthrough

Restaurant operations platform built end to end for a real restaurant: offline-first React PWA, Go services and SQS workers, iFood and 99Food integrations, Terraform on Google Cloud and AWS. Private codebase, shown in a video walkthrough.

Tech: Go, React, TypeScript, PostgreSQL, Redis, SQS, S3, Docker, Terraform, Google Cloud

CKA Sim GitHub

Kubernetes CKA exam simulator: a real 3-node cluster with a browser terminal and auto-graded hands-on tasks. Runs locally on Docker or hosted on GKE, one isolated lab per user.

Tech: Go, Kubernetes, GKE, kind, Docker, TypeScript, Vite, xterm.js, WebSockets, Bash

Social Deduction Game GitHub

Real-time multiplayer game built as a Domain-Driven Design study: rich entities, domain events and SOLID.

Tech: TypeScript, Node.js, WebSockets, React, DDD, Vitest, Playwright

EDUCATION

Bachelor of Engineering (B.Eng.), Mechanical Engineering 2017 – 2022

UDF Centro Universitário · Brasília, Brazil

CERTIFICATIONS

AWS Certified Solutions Architect – Associate · Amazon Web Services (Sep 2024)
